Slot: C

Course Name: DEEP LEARNING

Course Faculty: Dr D Sudhagar

Project Title: Deep Learning-Based Smart Real-Time Emergency Resource Allocation and Inventory Monitoring System

MODULE 2 :Inventory Monitoring & Availability

The screenshot shows the Incident Management dashboard with a table of incidents. The table includes columns for Incident, Type, Severity, Status, Zone, Casualties, Reported, and Update Status.

Incident	Type	Severity	Status	Zone	Casualties	Reported	Update Status
Rajasthan Heat Wave Emergency — Jaipur	Medical	critical	responding	9 22	34	May 9, 2018	responding
Kashmir Avalanche — Sonmarg Pass	Collapse	critical	active	9 26	10	May 9, 2018	active
Manipur Landslide — Senapati District	Collapse	critical	responding	9 25	31	May 9, 2018	responding
Hyderabad Multi-Storey Collapse — Secunderabad	Collapse	critical	responding	9 23	14	May 9, 2018	responding

Project Description:

The Deep Learning-Based Smart Real-Time Emergency Resource Allocation and Inventory Monitoring System is an intelligent emergency management solution designed to monitor resource availability and allocate essential resources efficiently during critical situations. The system collects real-time information about emergency requests, resource requirements, inventory levels, and resource locations. Deep learning techniques are used to analyze emergency patterns and predict the type and quantity of resources required. The inventory monitoring module continuously tracks available stock, identifies low-stock and critical-stock conditions, and generates alerts when resources need replenishment. Based on emergency severity, resource demand, availability, and location, the system prioritizes requests and recommends suitable resources for allocation. This integrated approach helps reduce resource shortages, minimize allocation delays, improve inventory utilization, and support faster and more effective emergency response and decision-making.
